Step 1 – T & C Humates - April 1 (March - April)

In the early spring your lawn needs a complete soil fertility builder - to help it recover from the rigors of the harsh winter. **T&C Humates**, contains humates and a wide array of minor and micro-nutrients including iron in a totally natural form that not only adds nutrients to the soil, but releases “tied up” nutrients already in the soil so they can be used by the plant. Soil Activator doesn’t just force-feed the plant; it actually gets to the root of the problem and improves the soil for the long term.

A secondary benefit of using T & C Humates is the decomposition of thatch in the lawn. The humates in Soil Activator speed up the decomposition process that prevents dead grass stems and roots from creating the tight spongy layer that hinders proper absorption of water and nutrients. The result is not only a visibly healthier lawn but also the elimination or reduction of the need to power-rake (de-thatch) your lawn.

Step 2 – Town & Country Premium Lawn Food – May 15 (May - June)

In the late spring your lawn needs a boost that will carry it into summer. **Town & Country Premium Lawn Food** contains all the nutrients, including a high percentage of iron, which your grass needs to keep it healthy and give it that deep green color that you want for your lawn. Town & Country Premium Lawn Food contains three types of nitrogen, including 60% polymer coated slow-release nitrogen for extended greening of up to 12 weeks. You can’t buy a better lawn food. We guarantee it!

Step 3 - Fertilome Weed Out + Lawn Fertilizer – Sept. 15 (August - September)

In early fall, as the temperatures begin to cool, it is time to apply **Fertilome Weed Out + Lawn Fertilizer**. The lawn is now beginning to store nutrients in its roots in preparation for dormancy. During this period weed killers are particularly effective because the herbicide travels deep into the root, rather than just “top killing”. Fertilome Weed Out + Lawn Fertilizer contains 3 herbicides that control over 200 listed broadleaf weeds. **Do not mow lawn prior to application. Lawn should be lightly wet before application, but do not water for 24 hours after application.**

Step 4 – Town & Country Lawn Winterizer - Oct. 15 (October-November)

Late fall is probably the most important feeding of the year. Application can be made anytime in the fall, but the ideal time to apply **Town & Country Lawn Winterizer** is in October or November. Since your lawn is approaching dormancy now, nearly all of the nutrients are used to promote root growth and very little for top growth. Town & Country Lawn Winterizer contains extra potassium for winter hardiness and 30% slow release nitrogen. This builds a very dense, healthy turf and provides stored nutrients that will encourage early spring green up, often up to two weeks earlier than lawns that don’t receive a fall feeding.

Broadleaf Weed Control

If you need additional help in controlling dandelions and other broadleaf weeds, spray with **Fertilome Weed-Free Zone** in April or Early May just before the dandelions bloom. This will kill any weeds that the Fertilome Weed Out + Lawn Fertilizer may have missed the previous fall. Do not spray when temperature is expected to exceed 85 degrees.

Grub Control

Lawn insects, particularly Billbugs and White Grubs, can destroy large patches of your lawn very quickly. The problem can be prevented with an application of **Grub Free Zone**. The timing is critical. Apply in May, before any damage occurs, for best results. You may need to reapply in early July
